

# Motivation

A motivating goal of tropical algebra is to develop a tropical geometry tool-kit for studying matroid theory.

## A (very) Open Problem

- ▶ A tropical ideal is a (valuated) (finitary) matroid on  $\mathbb{Z}^n$  whose automorphism group contains  $\mathbb{Z}^n$  itself.
- ▶ this structure gives us robust geometry compatible with tropical scheme theory.
- ▶ **Question:** Can we consider "matroids on  $G$ " with automorphism group containing  $G$ ? When  $G = \mathbb{Z}^n$  we arrive at tropical ideals, and there are considerable geometric consequences.
